# **RADEL: Resilient and Adaptive Distributed Edge Learning in Dynamic Environments**

Qiyuan Wang

November 2025

# The Evolution of Edge Intelligence

## Context and Challenges

### The Promise of Edge Computing:

- ▶ Real-time analytics at the network periphery
- ▶ Decentralized machine learning where data originates
- ▶ Responsive services across distributed environments

### Five Critical Challenges in Edge Learning:

- ▶ **Node failures** compromise service continuity
- ▶ **Concept drift** degrades model performance over time
- ▶ **Irrelevant data** reduces prediction accuracy
- ▶ **Communication inefficiencies** limit scalability
- ▶ **Client mobility** undermines learning assumptions

**We need resilient and adaptive solutions!**

# The RADEL Framework

## Five Interconnected Contributions

### Core Philosophy:

- ▶ **Resilience:** Maintain service during failures
- ▶ **Adaptability:** Respond to changing conditions
- ▶ **Efficiency:** Minimize resource consumption

### Contributions 1-2:

- ▶ Resilient predictive analytics
- ▶ Maintenance under drift

### Contributions 3-5:

- ▶ Query-driven learning
- ▶ Dynamic personalized FL
- ▶ Mobility-aware FL

**A comprehensive framework for practical edge deployment**

# Paper 1: The Resilience Challenge

## Maintaining Service During Node Failures

### Problem Statement:

- ▶ Edge nodes fail unpredictably (hardware, network, power)
- ▶ Replication-based methods are resource-intensive
- ▶ Need: Lightweight resilience mechanism

### Core Innovation - Enhanced Local Models:

- ▶ Surrogate nodes serve requests of failing nodes
- ▶ Leverage **statistical signatures** of neighboring data
- ▶ Build enhanced models through information extraction

### Key Strategies:

- ▶ **Information Adjacency:** Leverage spatial/statistical proximity

# Paper 1: Results and Impact

## Significant Performance Improvements

### Experimental Setup:

- ▶ Multiple real-world datasets
- ▶ Various failure scenarios
- ▶ Comparison with centralized method

### Key Results:

- ▶ Substantial accuracy improvements
- ▶ Minimal data transfer required
- ▶ Scalable to large networks

### Contribution:

- ▶ Novel resilience without full replication
- ▶ Foundation for reliable edge services

# Paper 2: The Concept Drift Challenge

## Preserving Resilience Under Evolving Data

### The Problem:

- ▶ Enhanced models degrade as data distributions evolve
- ▶ Concept drift is inevitable in dynamic edge environments
- ▶ Need: Efficient maintenance strategies

### Analyzing Drift Impact:

- ▶ Studied effects of different drift types on enhanced models
- ▶ Quantified **performance degradation patterns**

### Maintenance Strategies:

- ▶ **Mock Data (MD)**: Synthetic data generation approach
- ▶ **Enhanced Centroid Guided (ECG)**: Efficient targeted updates

# Paper 2: Optimal Maintenance Trade-offs

## Balancing Communication and Adaptation

### Evaluation:

- ▶ Synthetic datasets with controlled drift
- ▶ Real-world datasets with natural evolution
- ▶ Heterogeneous data sources

### Key Achievements:

- ▶ **Optimal trade-offs** between transmission and effectiveness
- ▶ Maintained performance across heterogeneous sources
- ▶ **Minimized overhead** during adaptation

### Contribution:

- ▶ Systematic approach to resilience maintenance
- ▶ Practical deployment guidelines

# Paper 3: The Data Relevance Problem

Not All Data is Equally Useful

## Key Insight:

- ▶ Traditional approaches: Use all available data
- ▶ Reality: Query patterns reveal **relevant data regions**
- ▶ Irrelevant data can actually degrade model performance

## Challenge:

- ▶ Identify relevant data from queries
- ▶ Determine when to stop refinement
- ▶ Adapt to changing patterns

## Solution:

- ▶ Query-driven identification
- ▶ Optimal stopping theory
- ▶ Adaptive update mechanisms

# Paper 3: Framework Components

## Data-Centric Learning Mechanism

### Core Innovation: Query-Driven Identification

- ▶ Queries reveal which data regions are **actually relevant**
- ▶ Progressive discovery: Start with initial model  $f_0$  on all data  $\mathcal{D}$
- ▶ Each query identifies relevant samples  $\rightarrow$  Build  $\mathcal{D}_t$  incrementally
- ▶ Train refined models  $\{f_t\}$  only on discovered relevant regions

### Supporting Components:

#### 1. Model Selection:

$$f_{t+1} = \begin{cases} f_t & \text{if } \epsilon_t < \gamma_t \epsilon_{t-1} \\ f_t^* & \text{otherwise} \end{cases}$$

- ▶ Explore vs. exploit:  $\gamma_t$  decays with  $t$

#### 3. Data Relevance Discriminator (SVM):

- ▶ Binary classifier  $f_C(x) \in \{+1, -1\}$  separates relevant vs. irrelevant regions
- ▶ Trained on  $\mathcal{D}_R$  (relevant) and  $\mathcal{D}_I$  (irrelevant) from learning process

#### 2. Optimal Stopping:

- ▶ When to stop refinement?
- ▶ When to update for drift?
- ▶ Theory provides optimal  $T^*$  and  $k^*$

# Paper 3: Dramatic Performance Gains

Learning from What Matters

## Experimental Setup:

- ▶ Diverse datasets and query workloads
- ▶ Compared against full-data baselines

## Impressive Results:

- ▶ Up to 63% improvement in accuracy
- ▶ Consistently outperforms traditional approaches
- ▶ Lower computational cost
- ▶ Robust under distribution drift

## Contribution:

- ▶ Paradigm shift: Quality over quantity
- ▶ Practical query-aware learning

# Paper 4: The Personalization Challenge

## DA-DPFL Framework Overview

### Challenges in Personalized Federated Learning:

- ▶ **Data heterogeneity** across clients (non-i.i.d.)
- ▶ **High communication costs** in model exchange
- ▶ **Computational overhead** at resource-constrained edge devices

### DA-DPFL Innovation:

- ▶ **Dynamic aggregation** in decentralized topology
- ▶ **Knowledge reuse** within communication rounds
- ▶ **Sparse-to-sparser pruning** based on compressibility

### Key Insight:

- ▶ Knowledge reuse can be achieved in each round if tolerating time cost
- ▶ Progressive pruning greatly reduces communication and computation

# Paper 4: Technical Approach

## Dynamic Aggregation Mechanism

### System Model:

- ▶ Decentralized topology: No central server
- ▶ Peer-to-peer model exchange among neighbors
- ▶ Each client maintains personalized model

### Sparse-to-Sparser Pruning:

- ▶ Pruning based on **compressibility**
- ▶ Progressive pruning: Start sparse, become sparser
- ▶ Preserve critical connections while reducing size

### Benefits:

- ▶ Reduced training computation
- ▶ Lower communication overhead
- ▶ Personalized models for each client

# Paper 4: Efficiency and Performance

## Achieving Superior Trade-offs

### Evaluation Setup:

- ▶ Non-i.i.d. data partitioning
- ▶ Multiple FL benchmarks
- ▶ Compared with SOTA DPFL methods

### Outstanding Results:

- ▶ Superior test accuracy
- ▶ Up to 5× energy reduction
- ▶ Significant communication savings
- ▶ Effective personalization

### Contribution:

- ▶ Novel dynamic aggregation
- ▶ Practical for edge devices
- ▶ Scalable decentralized learning

# Paper 5: The Mobility Challenge in FL

MOBILE - Mobility and Outage-Based Intelligent Learning

## Reality of Mobile Federated Learning:

- ▶ Clients are **constantly moving**
- ▶ Network conditions **fluctuate dramatically**
- ▶ Connection drops are **common**, not exceptional

## The Energy Constraint Fallacy:

- ▶ Existing work assumes: Energy is primary bottleneck
- ▶ Reality: Modern phones when transmitting: 1.5-2.5 Watts
- ▶ Phone batteries:  $\sim 66,600\text{J}$ , GPU TDP: up to 450W
- ▶ **The real problem is mobility, not energy!**

## MOBILE's Paradigm Shift:

- ▶ First framework prioritizing **mobility patterns** over energy
- ▶ Uses **historical movement data** for reliability prediction
- ▶ Joint optimization of client selection and bandwidth allocation

# Paper 5: Mathematical Formulation

## Portfolio Optimization Approach

### Return Vector - Capturing Proximity:

$$r_k^t = 1 - \frac{d_{k,t}}{d_{\max,t}} \quad (1)$$

- ▶ Higher return  $\rightarrow$  Closer to BS  $\rightarrow$  More reliable

### MIQP Optimization:

$$\max_{\mathbf{a}, \mathbf{b}} \sum_{t=0}^{T-1} \underbrace{\mathbf{r}_t^\top \mathbf{b}_t}_{\text{Expected return}} - \underbrace{\lambda \mathbf{b}_t^\top Q_t \mathbf{b}_t}_{\text{Risk penalty}} + \underbrace{\gamma \|\mathbf{a}_t\|_1}_{\text{Participation}} \quad (3)$$

### Covariance Matrix - Learning from History:

$$Q_t = \frac{1}{W} \sum_{\tau=t-W+1}^t (\mathbf{r}_\tau - \bar{\mathbf{r}}_t)(\mathbf{r}_\tau - \bar{\mathbf{r}}_t)^\top \quad (2)$$

- ▶ Captures spatio-temporal correlations between clients
- ▶ Clients that "move together" have high covariance

# Paper 5: Transformative Results

## Making FL Practical for Mobile Deployments

### Experimental Setup:

- ▶ YJMob100K dataset
- ▶ 100K users, 75 days
- ▶ CIFAR10, CIFAR100, HAM10000

### Game-Changing Performance:

- ▶ Success rate: 32% → 89%
- ▶ Wasted bandwidth: 73% → 30%
- ▶ Higher accuracy, stable convergence

**Contribution:** Paradigm shift from energy to mobility; practical mobile FL framework

### Key Features:

- ▶ Orthogonal to existing FL algorithms
- ▶ Cold-start strategy for bootstrap
- ▶ Minimal computational overhead

# Conclusions and Future Directions

## RADEL: Resilient and Adaptive Distributed Edge Learning

### Key Contributions:

- ▶ **Resilience:** Service continuity during node failures
- ▶ **Adaptability:** Maintenance under concept drift
- ▶ **Query-driven:** 63% accuracy improvement
- ▶ **DA-DPFL:** 5× energy reduction
- ▶ **MOBILE:** 177% success rate improvement

### Future Directions:

- ▶ *Short-term:*
  - ▶ Component integration
  - ▶ Multi-tier architectures
  - ▶ Adaptive parameter tuning
- ▶ *Long-term:*
  - ▶ Predictive mobility modeling
  - ▶ Privacy-preserving techniques
  - ▶ Federated continual learning
  - ▶ Game-theoretic incentives

**RADEL: A robust foundation for reliable,  
adaptive machine learning at the edge!**

# Thank you!
